## What is Narcolepsy? Idiopathic Hypersomnia?

Narcolepsy is a chronic neurological disorder of the sleep/wake cycle, affecting 1 in 2,000 people, including 200,000 Americans.

Experts state that, “For children with narcolepsy, the stigma of increased daytime sleep can affect social acceptance and increases risks of future psychiatric disorders, potential obesity, and depressive symptoms.”

Idiopathic hypersomnia is a chronic neurological disorder marked by an insatiable need to sleep that is not erased by a full night’s slumber.

Greater awareness of these conditions will decrease misconceptions and stigma – and lead to quicker diagnoses.

### Meet Jack:

Jack was diagnosed with narcolepsy at age 15, with symptoms developing earlier. He faced challenges in the classroom, yet diagnosis and treatment helped him excel in high school and college. Most recently in 2018, Jack graduated from the University of Arizona, with a major in Economics and minors in Business Administration and Psychology. He is currently working in software sales in San Diego, CA. The adversity Jack faced in school inspired his family to co-found this scholarship with Julie Flygare.

### Meet Julie:

Julie Flygare, J.D. is the founder of Project Sleep and author of *Wide Awake and Dreaming: A Memoir of Narcolepsy*. She was diagnosed with narcolepsy at age 24, during her second year of law school. After graduating, Julie dedicated herself to raising awareness about narcolepsy. Read her blog at [www.julieflygare.com](http://www.julieflygare.com).
